

FleetView – Prototype Demo Guide

Purpose: Demonstrate the FleetView concept (live bus visibility + driver/admin updates) and gather feedback from school stakeholders and parents.

Prototype Disclaimer (Say this early)

This is a clickable prototype used for research and pricing discovery. It simulates live GPS and notifications so we can validate interest and understand what the school would be willing to pay.

Before the Meeting (60 seconds)

- Open the prototype in Chrome/Edge/Safari.
- Confirm the map loads and the bus icon is moving.
- Confirm notifications appear in Admin when you trigger a delay or driver issue.

5-Minute Prototype Walkthrough

- Parent view: Show the map + bottom sheet for Roy Jr (read-only).
- Bottom sheet: Expand/collapse; the route remains visible behind it.
- Driver view: Pause/Resume + Report Issue (simulate congestion/roadworks).
- Admin view: Show Dispatch Console with tabs (Overview, Routes, Drivers, Vehicles, Parents/Students, Reports, Settings).
- Trigger a delay and show the notification feed update instantly.

Key Messages

- Parents gain certainty and stop calling the office for updates.
- Drivers have a simple interface designed for quick taps (not distracting).
- Admins can manage multiple routes and send one update to everyone.
- Access and privacy are school-controlled (role-based in production).

Close with: "If this existed today, would you want it for your transport community?"

Note: The prototype is a simulation. Production would integrate real GPS devices/apps, secure parent access, and auditing.

FleetView – Prototype Research & Pricing Discovery

Research Goal

Measure school interest, identify must-have features, and determine willingness-to-pay (WTP) before building the full product.

What This Prototype Demonstrates

- Parent experience: visibility, ETA, next stop, confidence.
- Operational experience: driver issue reporting and admin broadcast updates.
- Admin breadth: multi-route management and onboarding flows (UI only).

Admin Console Tabs (What They Represent)

Tab	Represents
Overview	Dashboard + quick actions + notification feed.
Routes	Multiple routes with schedules, stops, student counts.
Drivers	Onboarding (invite/upload) + driver status.
Vehicles	Fleet list + GPS/device status + maintenance reminders (future).
Parents/Students	Roster management + assignment to routes/stops (future).
Reports/Settings	On-time performance, templates, roles/permissions (future).

Questions to Ask the School (WTP & Fit)

- How often do parents contact the office about bus timing today?
- Which routes are most problematic (late, traffic, missed pickups)?
- Who would own this internally (transport coordinator, admin, provider)?
- If it reduced calls and complaints, what would it be worth per month?
- Would you prefer pricing per bus, per route, or per student?
- What would stop you from adopting a solution like this?

Pricing Discovery Approach (Simple)

- Start with a range: “Would \$X–\$Y/month be reasonable if it reduced calls and complaints?”
- Anchor to outcomes: fewer calls, fewer complaints, better parent experience.
- Test packaging: Essentials (tracking + alerts) vs Plus (rosters, reports, templates).
- Ask for next step: “If we built this, would you trial it or sponsor rollout for one term?”

Outcome of this meeting: A clear signal of demand, feature priorities, and a realistic price point before building.
